Introduction of the Study

The capstone project "Ticket on the Go" is a mobile-based application intended for selling and inquiring ticket for events. The application will have an admin panel that manages the registered users who inquire for tickets.

An event requires audiences for it to be considered successful. Planning an event put the organizer in a tough situation to make it amazing and attract a lot of audiences. Usually, event organizers sell ticket to people to let them attend the event. But selling tickets manually can be a huge challenge to the event planners especially when they are busy working hard planning thoroughly the event to be successful and would satisfy the audiences. They need a platform wherein they can easily sell the tickets to their target audiences.

Proposed Solution

To provide solution for the aforementioned problems, the researchers of the study proposed a mobile-based ticketing app. The application will be used to sell and buy tickets for a specific event. The application will be used by both the admin and the users. The admin are the event organizers who wish to sell tickets quickly and conveniently. The users of the application are those who wish to conveniently inquire tickets for a

specific event. The application will let the event organizers and audiences save time and effort.

Objectives of the Study

General Objective – the main goal of the project is to design and develop a mobile-based application for selling and inquiring tickets for events.

Specifically, the project aims the following objectives:

1. To develop an application that will automate selling and buying event's ticket.
2. The output of the study is a mobile application that will help event organizers market their tickets conveniently.
3. The application will help users to inquire for tickets without exerting too much effort.
4. Complete the development of the system according to the timeframe or project schedule.
5. To produce documentation that records the phases, task and deliverables of the study.
6. The app will have a user-friendly interface.
7. The application is safe, accurate, reliable and convenient to use.
8. To evaluate the developed system using a standard questionnaire and self-made evaluation tool with the following quality characteristics
    1. Functionality
    2. Reliability
    3. Usability
    4. Efficiency
    5. Maintainability
    6. Portability

Significance of the Study

The success of the study is deemed beneficial to the following groups/individuals:

Event Organizers. The application will help them ensure that there will be a lot of audiences to experience the event they organize. They can sell a lot of tickets using the system.

Audiences and Users. The success of the project will provide them a platform to conveniently buy a ticket for the events they wished to attend.

Researchers. The success of the study will add on the knowledge and skills of the researchers as programmers. Capstone project subject is a venue for the researchers to showcase their skills in the field of computer programming, web development and in research in general.

Future Researchers. The study can serve as their reference if they wish to pursue the same study.

Development Tools of the Event Ticketing App

The researchers will use the concept of responsive web design and development. With that, the proposed capstone project on event management system will be designed and developed in Bootstrap, PHP and MySQL or MariaDB. Bootstrap is a responsive web framework used to develop web and mobile friendly web application. PHP and Javascript will be used primarily for the functionalities of the project. Relational database management system will also be one of the components of this study and the researchers will use MySQL or MariaDB.

Scheduler and Planner App Chapter 1 Documentation

Scheduler and Planner App Chapter 1 Documentation

Chapter 1

THE PROBLEM AND ITS BACKGROUND

Introduction

Students and Professionals are known as types of people that are having hard time in organizing schedules for academic activities, extracurricular events, company meetings, seminars, company outing, out of the country tours and family bonding. Having tight schedule among all types of people in 20th century is a big difficulty, that is one of the main reason people have their own planner or diary where in people can write all the recent and upcoming activities or tasks to keep track of what to do in the near future.

Diary is a form of autobiographical writing, a regularly kept record of the diarist's activities and reflections. Written primarily for the writer's use alone, the diary has a frankness that is unlike writing done for publication. It's ancient lineage is indicates by the existence of the term in latin, diarium, itself derived from dies ("day").

The diary became to flower in the late Renaissance, when the importance of the individual began to be stressed. In addition to their revelation of the diarist's personality, diaries have been of immense importance for the recording of social and political history. (Encyclopedia Britannica, Smith John/ 2009 Print)

In this period of time, daily planner is a notebook consisting of date and time, where people can easily remember what date and day it is today when writing the day to day activities and plans.

Researcher has chosen this topic, for having the purpose to help the students and professionals simply arrange schedules, especially when some unexpected circumstances arrive.

As a student it is hard to check the schedules of free time, whenever there is an unexpected event, occasion, and circumstances that suddenly came up, because of this students must review noted schedules; or review the reminders in mobile phones to inform them about the recent activities that students are going to do. Due to these circumstances, it's a requirement that whenever students need to determine availability, students must look into the list of their tasks to be done in the certain period of time or ahead, normally a student nowadays use a reminder or a planner to remind them about the activities in ahead of time, and students need to analyze what day and time of recent the day, is available for unexpected circumstances.

On the other hand, Professionals such as businessmen, doctors, professors, engineers, use planners to take down notes about what happen today and what to do for the next day or months, or either way use reminders in mobile phones, smart phones, tablets, notes, and hire personal assistants to organize tasks for the day and the next day to be able to keep track of recent and future activities.

Due to modern type of technology in 20th century diaries, journal, and planners may be a good help for arranging schedules, but having a mobile phone with a reminder and an availability application will come in handy.

Availability of time application will be a great help for every people that are having hard time in knowing the available time for every unexpected events, an application that will help people generate the specific time of the day that students and professionals are available, total hours and days of users' availability, and can also serve as a planner in the users' own mobile phones.

Using Android Studio it can help us create and develop our application. Android Studio's features will enable us to develop a more accessible and must have types of applications.

Android services come in many categories in shapes and sizes all around the world. Having the wide range of device types, you can have a huge number of audiences with the application created. Some important variations that people should consider includes different languages, screen size and versions of android platforms.

Android studio is the official IDE (Integrated Development Environment) for the android application development. Android studio was specifically designed for developing applications. It is also designed to create an application using Advanced Android codes and refactoring.

Statement of the Problem

Researcher will develop an application that will come in handy for every person. The certain application will provide users immediate result about their schedules being input in the certain application.

In order for the researcher to successfully build up an application, here are some matters that this paper hopes to answer:

1. What are the application's limitations in terms of data input?
2. What are the design considerations desired to develop an applications in terms of:
    1. algorithm;
    2. data structures;
    3. software design and
    4. architectural design?

3. What are the hardware and software requirements in applying the Scheduler and Planner App?

4. What is the level of acceptance of the application in terms of the following?

1. Accuracy;
2. Efficiency; and
3. Reliability?

Assumptions

Below are the assumptions of the researcher about the study;

1. The application has the following;
2. It has the ability to generate your free time in a month
3. It can serve as a planner
4. It will produce an accurate output
5. The respondents will be interested in using the application to hasten up acquiring results.
6. The application will convince the respondent's expectation.

Scope and Limitations

In general the focus of this study was for the benefits of the students and professionals that is having problems in managing their time availability.

The mobile application, can be used without an internet connection, and will be focusing on generating your available time with its date, day and time. The mobile application was capable of letting user interact with the application depending on what the user inputs in the certain application.

The mobile application can only handle a month (day and time) of the users schedule depending on what period of month it is that the user is available or not and what month does the user input the tasks or activities.

In developing the application, Android Studio will be used as the Integrated Development Environment (IDE) and a User Interface to represent the certain application to the user.

Significance of the Study

The Proposed application intend to develop a better approach in this field of mobile application. The Researcher believe that this study would be very beneficial to the following:

Application Developers. This application will help the android application developers to be aware of the things to be consider in creating an application regarding time management.

Students. This mobile application will help the students organize the time of their study and leisure in the easiest way they can avail.

Professionals. This mobile application will help the professionals to put their schedules in the right order and tracking recent activities from the past, present, and future within the certain month to show them the users' free time.

Future Researchers. This application will develop users' way of organizing schedules or managing the time.

Definition of Terms

The terms that are enumerated and defined below will help the readers understand what is being discussed in every chapter.

Accessibility. Is the degree to which a product, device, service, or environment is available to as many people as possible. Accessibility can be viewed as the "ability to access" and benefit from some system or entity.

Accuracy. Freedom from mistake or error, the quality or state of being accurate

Algorithm. Step by step procedure designed to perform an operation, and which will lead to the sought result if followed correctly.

Android. Is a mobile operating system (OS) based on the Linux kernel and currently developed by Google.

Android Studio. Is an integrated development environment (IDE) for developing on the Android platform.

Android Platform. Is Google Inc.'s open and free software stack that includes an operating system, middleware and also key applications for use on mobile devices, including smartphones.

Application. Is a type of software that allows you to perform specific tasks. *Applications* for desktop or laptop computers are sometimes called desktop *applications*, and those for mobile devices are called mobile apps.

Application developer. Translate software requirements into workable programming code and maintain and develop programs.

Application Development. Used to develop prototypes of data entry screens, queries, forms, reports, tables, and labels for a prototype application.

Developer. A person concerned with facets of the software development process. In short developers "make software for the world to use".

Expert System. Is a computer program that simulates the judgment and behavior of a human or an organization that has expert knowledge and experience in a particular field.

Functionality. The quality of being suited to serve a purpose well.

Interactivity. In computer interactivity is the dialog that occurs between a human and a computer program.

IDE (Integrated Development Environment). is a programming environment has been packaged as an application program, typically consisting of a code editor, a compiler a debugger, and a graphical user interface builder.

Intelligence System. An intelligent system is a machine with an embedded, Internet-connected computer that has the capacity to gather and analyze data and communicate with other systems.

Java. Is a programming language expressly designed for use in the distributed environment of the Internet.

Mobile Application. Is a computer program designed to run on smartphones, tablet computers and other mobile devices.

Operating System. (OS) is software that manages computer hardware and software resources and provides common services for computer programs.

Software. A set of programs, which is designed to perform a well defined function.

SDK. Software development kit that enables developers to create applications for the Android platform.

Workspace. An environment used to build and test your application.

School Event Attendance Monitoring System Capstone Project

School Event Attendance Monitoring System Capstone Project

Table of Contents

- School Event Attendance Monitoring System Capstone Project
- Introduction
- Objectives of the Study
- Significance of the Study

The capstone project entitled “School Event Attendance Monitoring System” will utilize a barcode reader for the attendance since the identification card of the students has currently a barcode label attached to it. The value of the barcode is equivalent to their id number which is unique for every student of the institution. The

capstone project is available in Visual Basic and MS Access version, Visual Basic and MySQL version and web based version using PHP, MySQL and Bootstrap.

Introduction

The School Event Attendance Monitoring System will serve as a platform to monitor students' attendance during school events. The system will improve the process of checking the attendance of the students and monitor their attendance in every school event. The list of the students, officers, and events will be stored in the system wherein the officers will have an access and will be in charge in monitoring the attendance of the students every school event.

The system will improve the manual process of monitoring the attendance of students during school events. The manual processes which are mostly done by hand are prone to human errors. The officer in charge in monitoring may make a mistake in monitoring and keeping records of the students present in the event. There is also loads of paperwork and it is very time consuming. The manual process is very ineffective and out-dated.

The School Event Attendance Monitoring System will provide solution for these problems seen in the manual process. It will be easier to monitor the attendance using the system. The system will be responsible in keeping the records of students present during the school event. The process of monitoring will also be paperless which will lessen the time spent and hassle of the officer in charge.

Objectives of the Study

1. The system will serve as platform wherein the students' attendance during school events will be monitored.
2. The system can be easily used and accessible by the officer in charge.
3. The system will lessen the error in keeping students record of attendance.
4. The system will make the monitoring hassle-free and consume lesser time spent on it.
5. The system will provide a credible list of students who attended every school event.

Significance of the Study

Students. This is very useful for students especially to those who are actively attending school events; there effort will not be put in vain because there attendance will be securely recorded.

Teacher/Officer In-charge. This will help them check and monitor the students' attendance easily. They will have less paper work because the system already stored the information that is supposedly done via hard copy in the manual process. This system will help them lessen the time they spent in checking and monitoring their students' attendance.

Researchers. The study is a way to show the skills of the researchers in terms of computer programming, problem analysis and research related skills such as the preparation of documents, tabulating and presentation of the results and data gathering techniques and procedures.

Future Researchers. The output of this capstone project will serve as a guide and reference for the future students and researchers. The study can also be upgraded, updated and revised if they chose to conduct a similar study to this capstone project.

Online Bus Dispatch and Scheduling System Database Design

Online Bus Dispatch and Scheduling System Database Design

Introduction

The project entitled Bus Dispatch and Scheduling System is an online platform design and develop in PHP, MySQL and Bootstrap.

Displays information for dispatching list of buses, time, information about tickets and other information about buses. Provides easy access to makes schedule for buses. Provides security and user privacy access. Displays the bus information (time arrival, bus number, time schedule, etc.).

Electronic reports on system, next bus, and list of buses will arrive that time, by bus number and bus arrival basis for decision-making.

Significance of the Study

The results of the study were deemed beneficial to the following:

1. Terminal In charge. They were able to monitor the buses' record in an organized way as well as came up with decisions based on facts gathered by the system.
2. They were able to inquire and update obligations easily using one of the features of the developed system.
3. They were able to take their schedules for the arrival of their bus in the terminal. And also making their way to arrive on the exact time in the terminal.
4. They were able to check the information about the tickets if were given exactly to the passengers.
5. The passengers will now be able to view the schedule of trips online and using their smartphone.

Features:

Admin

- Manage Dispatcher (search, create, update, delete record)
- Manage Schedule (search, create, update, delete record)
- Manage Bus Info (search, create, update, delete record)
- Manage Driver (search, create, update, delete record)

Dispatcher

- Update the terminal Location of the bus

Viewer-Passengers

- View the schedule information in the bulletin board and in mobile app

The Online Bus Dispatch and Scheduling System will now produce an output which is the buses schedules (with time arrival, bus number, terminal Location of the bus).

Database Design (Database Schema)

tblbranch (branchid, branchlocation, dateadded)

Description: branch table will store information of the different bus stops or branch location.

Create Table SQL Statement:

```
CREATE TABLE `tblbranch` (
  `branchid` int(11) NOT NULL,
  `branchlocation` varchar(100) NOT NULL,
  `dateadded` varchar(100) NOT NULL
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

tblbus (busid, busnumber, bustype, dateadded, istravelling)

Description: tblbus will store information of buses such as the bus number/plate number, bus type (aircon, non-aircon), and if the bus is on travel or no.

Create Table SQL Statement:

```
CREATE TABLE `tblbus` (
  `busid` int(11) NOT NULL,
  `busnumber` varchar(15) NOT NULL,
  `bustype` varchar(15) NOT NULL,
  `dateadded` date NOT NULL,
  `istravelling` varchar(100) NOT NULL
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

Online Bus Dispatch and Scheduling System Bus Table

tbldriver (driverid, firstname, lastname, contactnumber, profilepicture, dateadded, istravelling)

Description: information of drivers suchas the firstname, lastname, contact number, profile picture will be stored in the tbldriver table.

Create Table SQL Statement:

```
CREATE TABLE `tbldriver` (
  `driverid` int(11) NOT NULL,
  `firstname` varchar(100) NOT NULL,
  `lastname` varchar(100) NOT NULL,
  `contactnumber` varchar(100) NOT NULL,
  `profile` varchar(100) NOT NULL,
  `dateadded` varchar(100) NOT NULL,
  `istravelling` varchar(100) NOT NULL
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

tblschedule (scheduleid, busid, driverid, originlocation, destinationlocation, departuretime, arrivaltime, terminallocation, status, statusoperation, arrivedatdestination, dateadded)

Description: schedule of trips will be stored in the tblschedule table, it includes the bus info, driver info, origin of location, the destination of the bus, departure time, estimated arrival time, the location of the bus, and the actual time of arrival in the destination.

Create Table SQL Statement:

```
CREATE TABLE `tblschedule` (
  `scheduleid` int(11) NOT NULL,
  `busid` varchar(100) NOT NULL,
  `driverid` varchar(100) NOT NULL,
  `originlocation` varchar(100) NOT NULL,
  `destinationlocation` varchar(100) NOT NULL,
  `departuretime` datetime NOT NULL,
  `arrivaltime` datetime NOT NULL,
  `terminallocation` varchar(100) NOT NULL,
  `status` varchar(100) NOT NULL,
  `statusoperation` varchar(100) NOT NULL,
```

```
  `arrivedatdestination` varchar(100) NOT NULL,
  `dateadded` datetime NOT NULL
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

tbluser (userid, branchid, firstname, lastname, username, password, usertype, dateadded)

Description: users of the system will be the dispatchers and the administrators that has a full control on all of the features of the system.

Create Table SQL Statement:

```
CREATE TABLE `tbluser` (
  `userid` int(11) NOT NULL,
  `branchid` int(11) NOT NULL,
  `firstname` varchar(100) NOT NULL,
  `lastname` varchar(100) NOT NULL,
  `username` varchar(100) NOT NULL,
  `password` varchar(100) NOT NULL,
  `usertype` varchar(100) NOT NULL,
  `dateadded` varchar(100) NOT NULL
) ENGINE=InnoDB DEFAULT CHARSET=latin1;
```

Online Bus Dispatch and Scheduling System Database Design

Flow of the System

1. Admin will encode first the following details
    1. Drivers
    2. Bus Info
    3. Dispatcher
2. Then Admin will encode the schedule of trips
3. The dispatcher will then update the trip if that bus reaches the bus stop or terminal. Ex. if the bus stops at terminal 1 then the terminal Location will then update, and the viewers from other terminal will be able to see that the certain bus is at terminal 1.
4. Passengers
    1. View the schedule information in the bulletin board

EHandbook in JQuery Mobile Free Source code

EHandbook in JQuery Mobile Free Source code

The zip file contains the source code and apk of the project entitled ehandbook or electronic handbook.

The said project is the mobile app version of the hardbound or booklet of the student handbook. All the contents of the handbook were included and posted on the application. The current version of the project is only available in android based smartphones and devices.

The next release and version of the app will have a control panel wherein the administrator of the system can modify the contents of the handbook which will be stored on a central database and can be downloaded by clients in their android devices.

Technicality of the Project

Development

Hardware Requirements

- Laptop
- Intel Dual Core Pentium 2.2 GHz
- Random Access Memory (RAM) 2 GB
- Hard Disk Drive
- Monitor 14” LCD
- USB QUERTY Keyboard
- USB Optical Mouse
- Android phone
- Android 4.4.4 KitKat OS
- 8 GB internal memory

Software Requirements

PHP: Hypertext Processor (PHP) and MYSQL: a widely use Open Source general-purpose scripting language that is specially used for web development. The main goal of the language is to allow web developers to write dynamically generated web pages quickly and an Open Source server-side (php.net).

JavaScript: a programming language that run most modern browsers. It supports object-oriented programming and procedural programming. It can be

used to control web pages on the client side of the browser, server-side programs, and even mobile applications (study.com).

Cascading Style Sheet (CSS): a language for describing the presentation of Web pages, including colors, layouts, and fonts. It allows one to adapt the presentation to different types of devices, such as large screens, small screens, or printers. CSS is independent of HTML and can be used with any XML-based markup language (www.w3.org).

Bootstrap: a framework to help you design websites faster and easier. It includes HTML and CSS based design templates for typography, forms, buttons, tables, navigations, modals, image carousels, etc. It also gives you support for JavaScript plugins (www.htmlgoodies.com).

Hypertext Markup Language: is the standard markup language for creating a web pages and web applications. With cascading style sheets (CSS) and JavaScript it forms a triad of cornerstone technologies for the World Wide Web (en.wikipedia.org).

JQuery Mobile (JQM): is a cross platform mobile framework designed to simplify and enhance the development of the mobile web applications by HTML5, CSS3, JQuery and JQuery UI into one framework that is not only robust, but maintainable and organized (www.htmlgoodies.com).

WebSQL: WebSQL is used for Local Database and Apache Cordova, a platform used for hybrid mobile applications using HTML, CSS, and Javascript. These allow the user to build mobile applications locally.

Cordova/Phonegap: Formerly known as Phonegap Build, a platform to build hybrid Mobile Applications using HTML5, CSS and Javascript.
